Thanks to members of the Passivhaus Trust for technical review.

# Small is beautiful but tricky in PHPP

Our model building:

2 floors

Square in plan

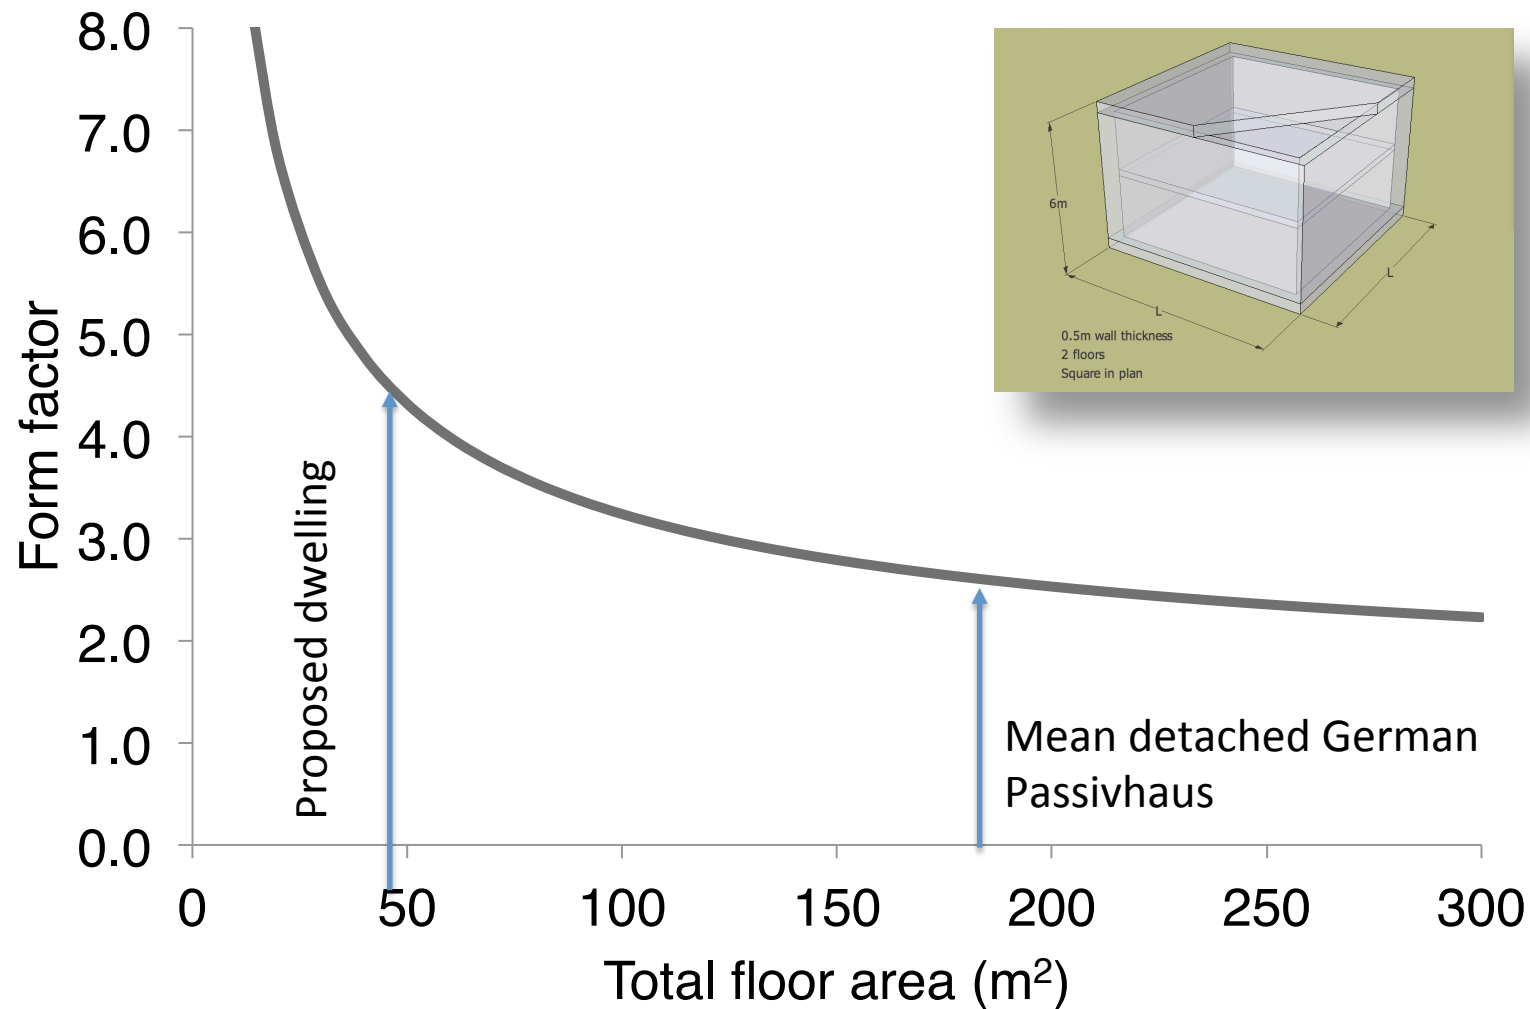

6m fixed height

0.5m wall, roof and floor thickness

L= 3.6m to 13.3m

# Plotting form factor v Floor area

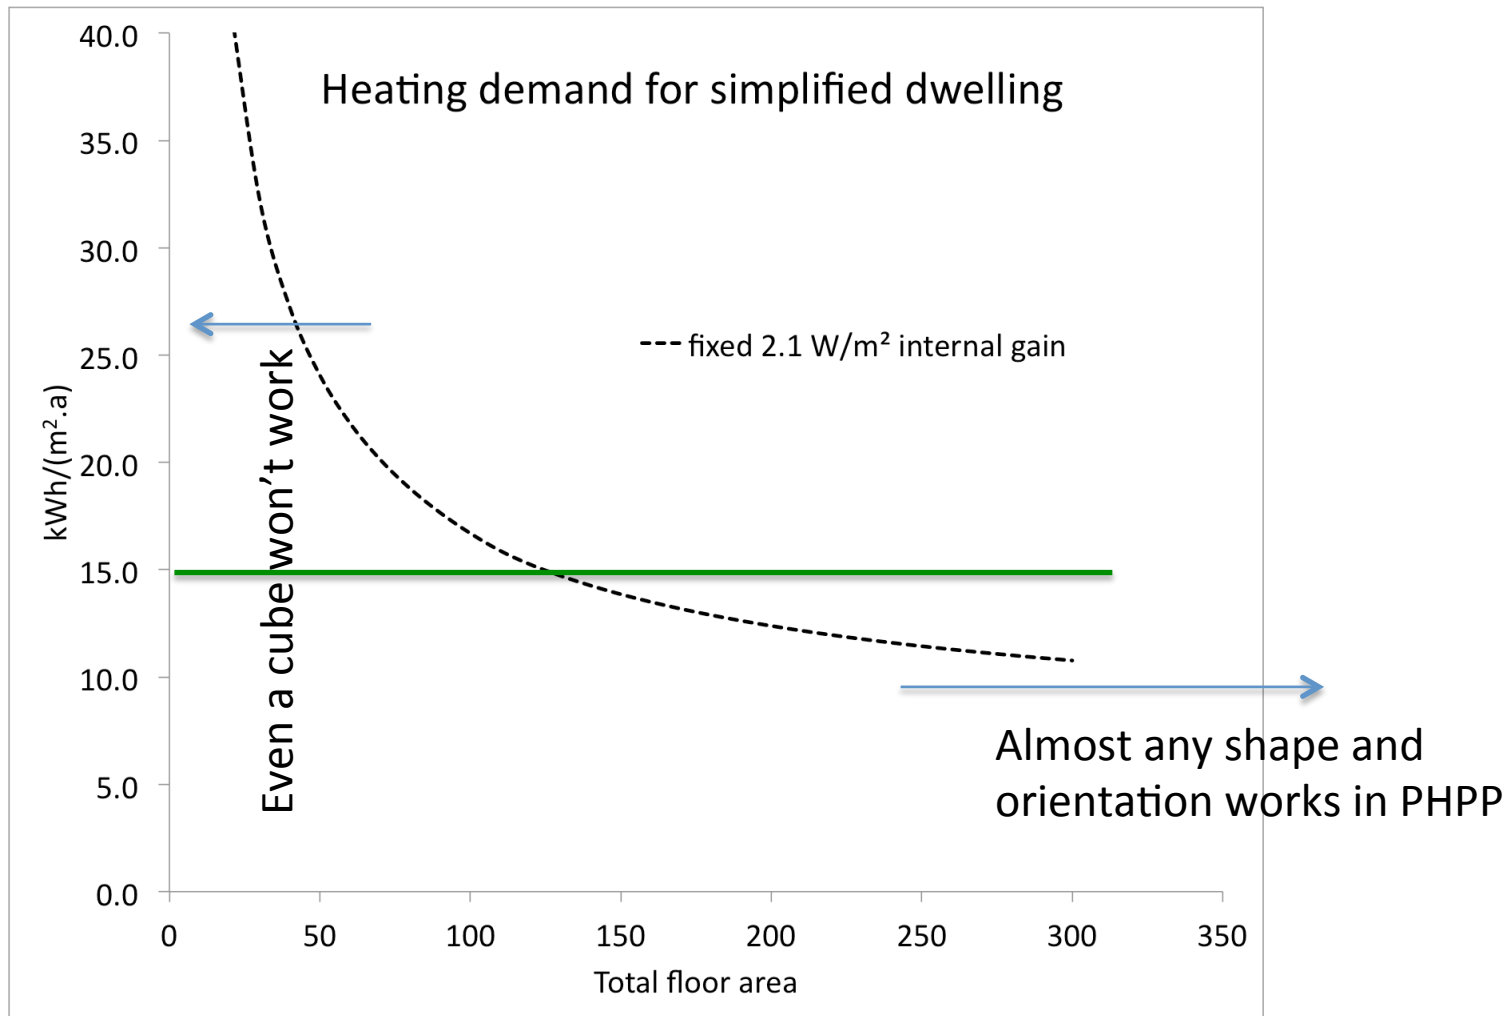

Form factor = heat loss area / floor area

# Plotting Annual heat v floor area

smaller dwellings appear less efficient

0.1 U values, PH vent and glazing, simplest form etc, same for all sizes

# But small area so should still use less?

This doesn't fit my anecdotal experience:  
15m<sup>2</sup> living off grid for 7 years, 100mm insulation & double  
glazed but cosy warm with twigs and body heat.  
1/3 not 3x the fuel to heat our larger super-insulated house

# What about a tiny envelope, in an extreme climate?

Is high form factor compensated by higher specific gains?

National Geographic

# About a third $\pm$ PH heating is from IHGs

# 2.1 W/m<sup>2</sup> IHG breakdown:

Calculated in PHPP IHG sheet (DHW not included):

## Per person:

Metabolic, lighting  
people, drying towels,  
some appliances

≅ 54W/p

## Per m<sup>2</sup>:

Aux electric, lighting  
space, DHW distribution,  
pot plant evaporation?

≅ 0.1W/m<sup>2</sup>

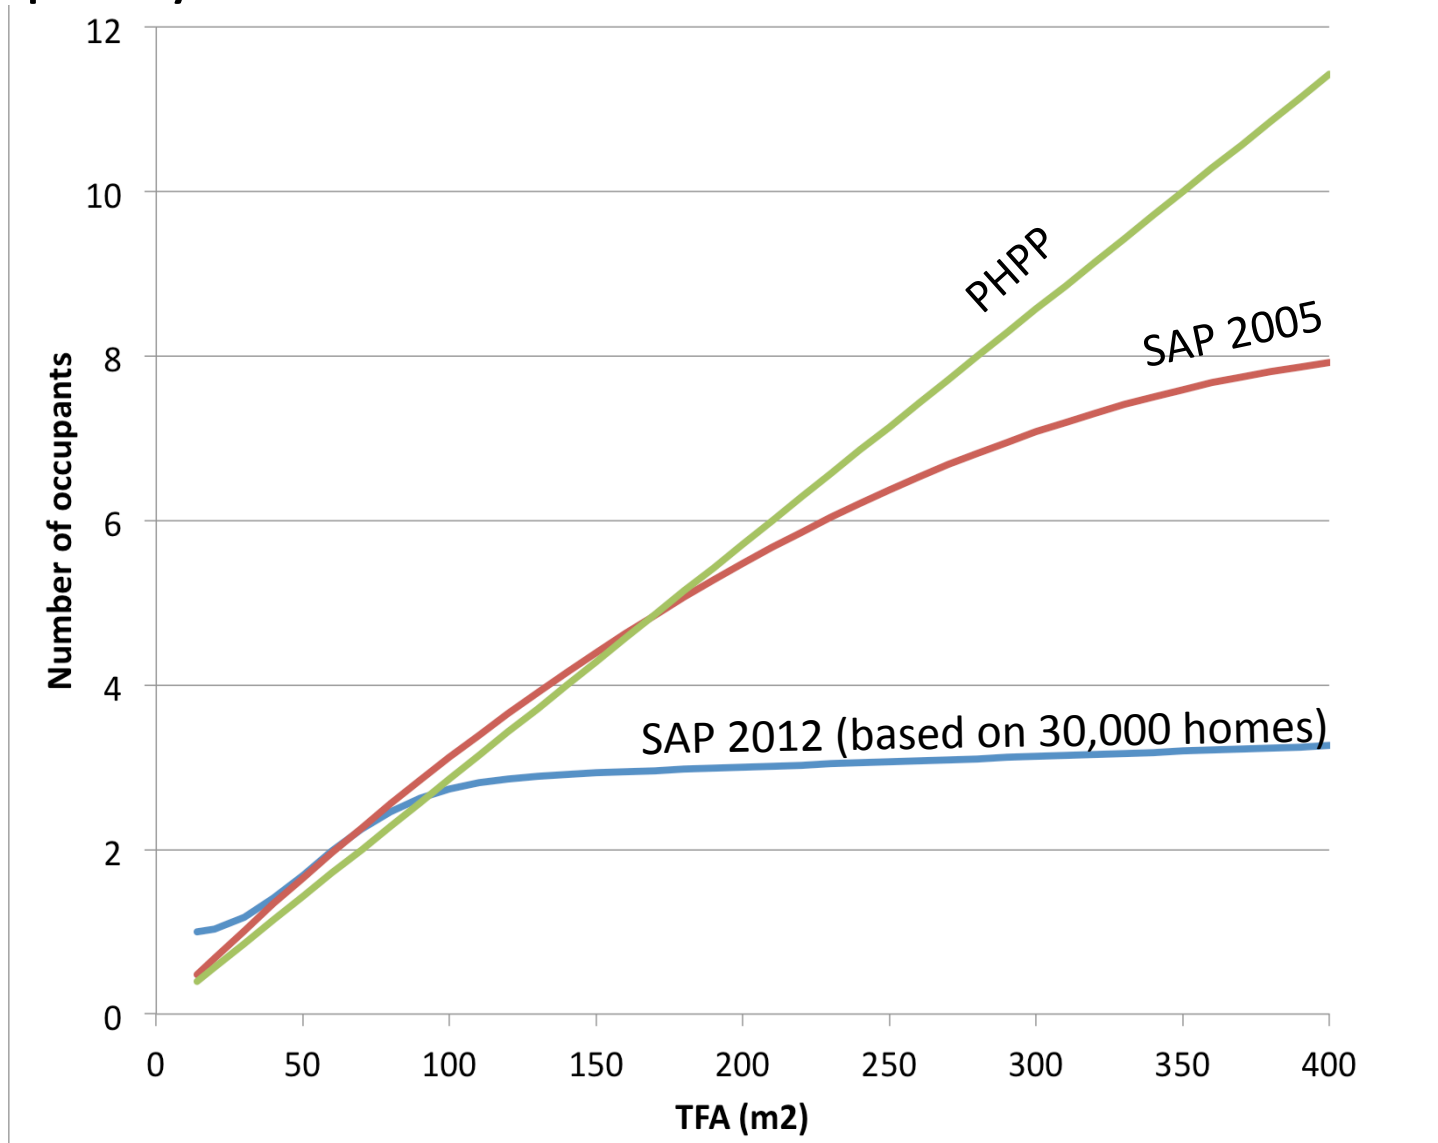

## Per dwelling:

Fridge, freezer,  
appliances, boiler  
DHW base storage

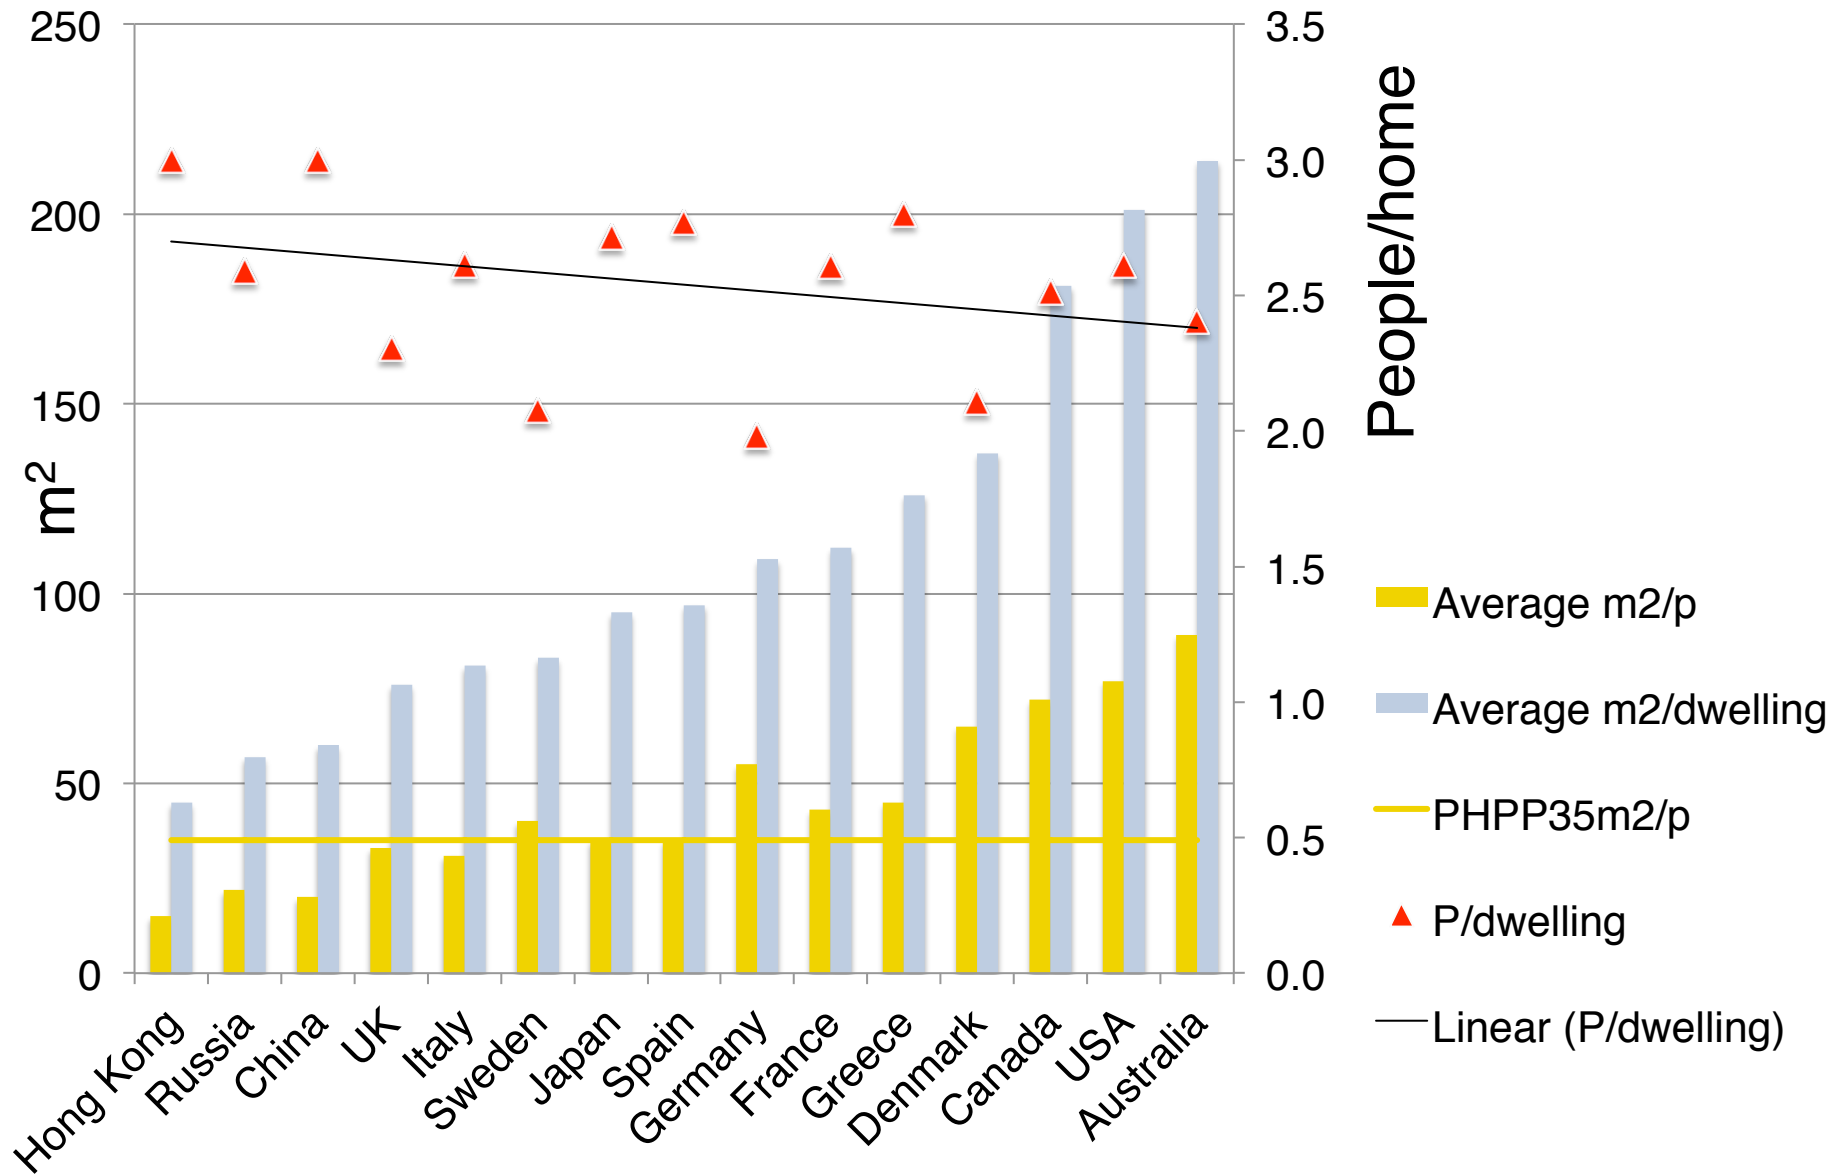

≅ 105W/dwelling

# But how many people?

Occupancy v TFA

# Is UK occupancy data relevant?

# IHG calculated using PHPP assumptions with BRE occupancy rate.

Passive House planning: **INTERNAL HEAT GAINS**

Building: **Slate Cottage**

Utilisation pattern: Dwelling **2.10** W/m<sup>2</sup>

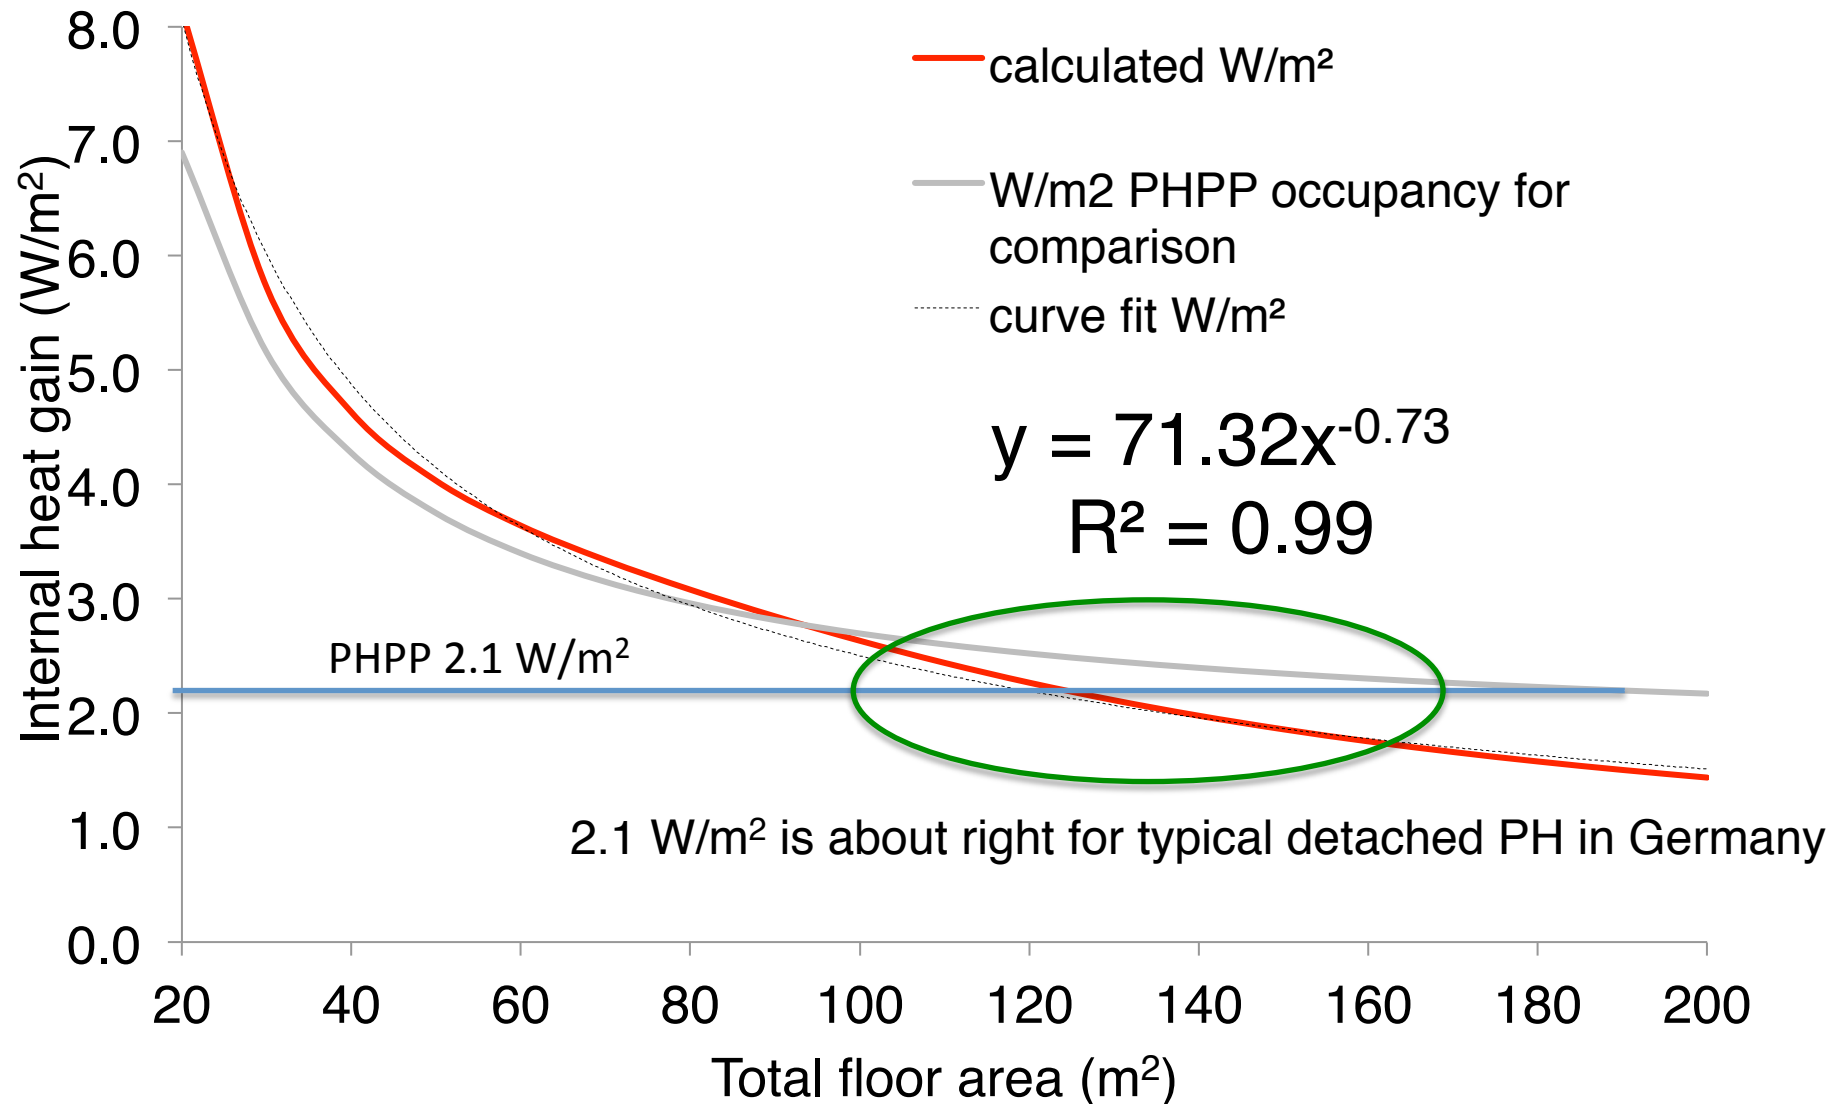

Type of values used: Standard **3.22** W/m<sup>2</sup> in summer

No data input necessary: **1.99** W/m<sup>2</sup>

[Go to utilisation pattern selection](#)

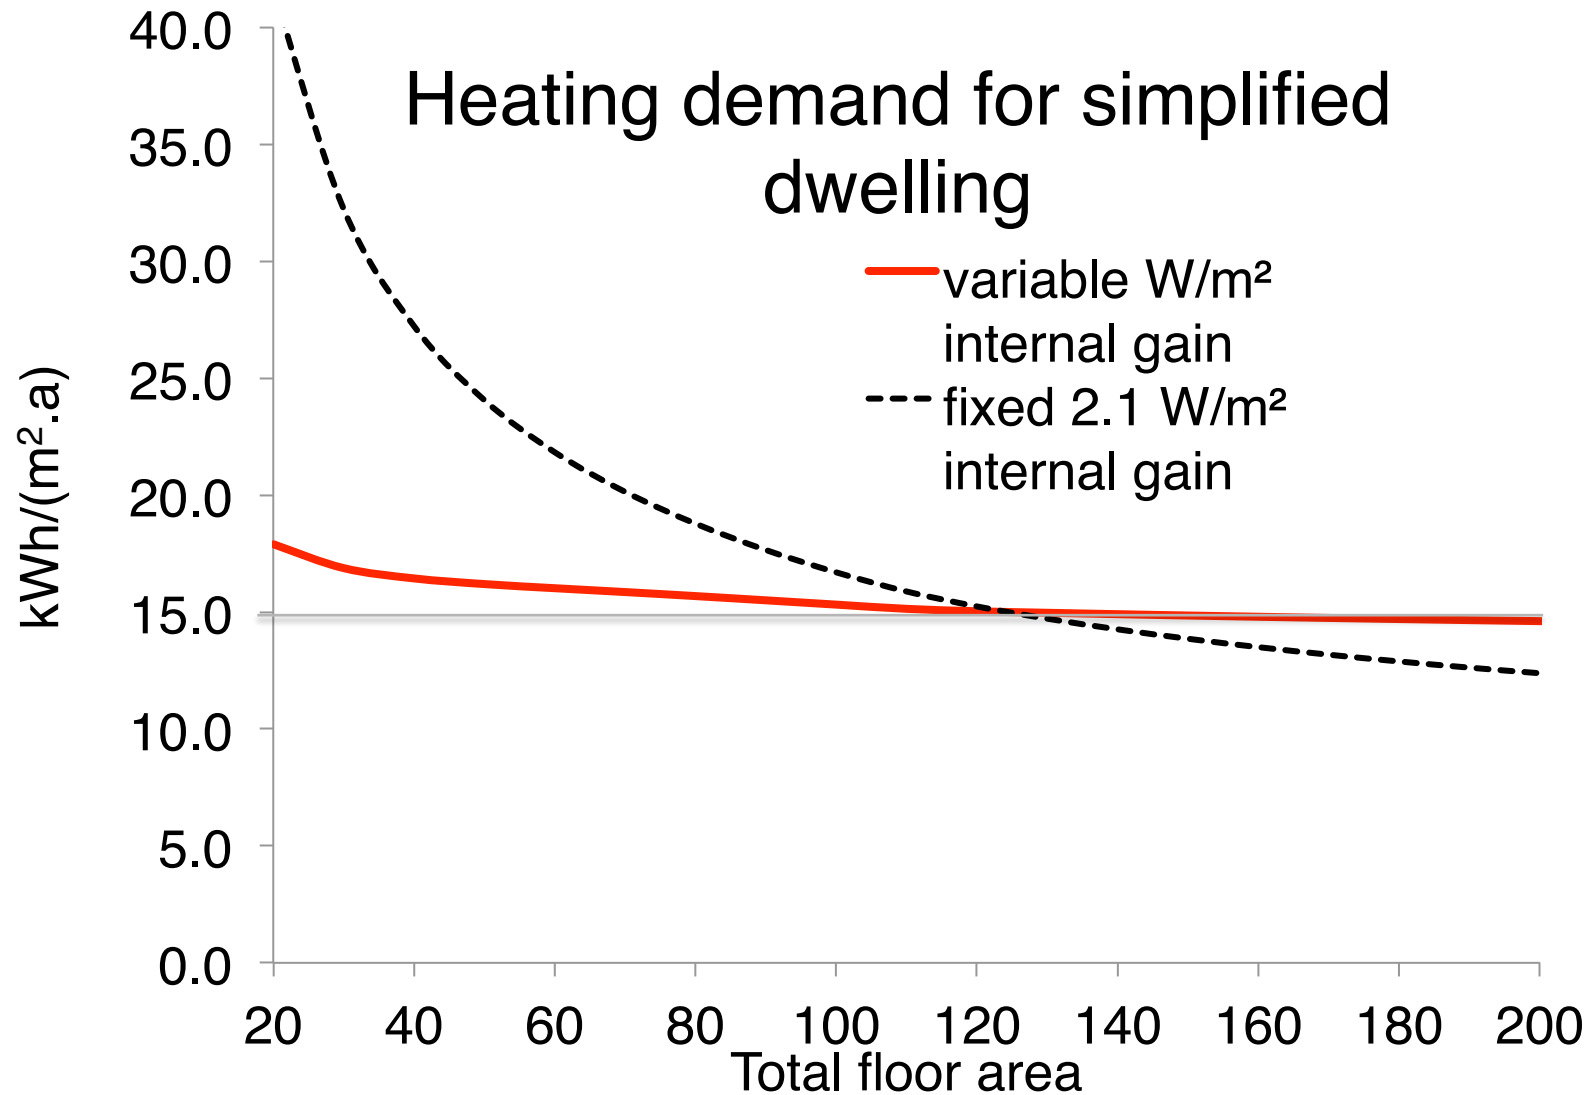

Calculation	Persons	Living area	P	Heating demand	Heating period

# IHG with BRE occupancy to obtain curve fit

# Annual Heat demand

Using  $IHG = 71TFA^{-0.73}$

*“All models are wrong, some are useful”*

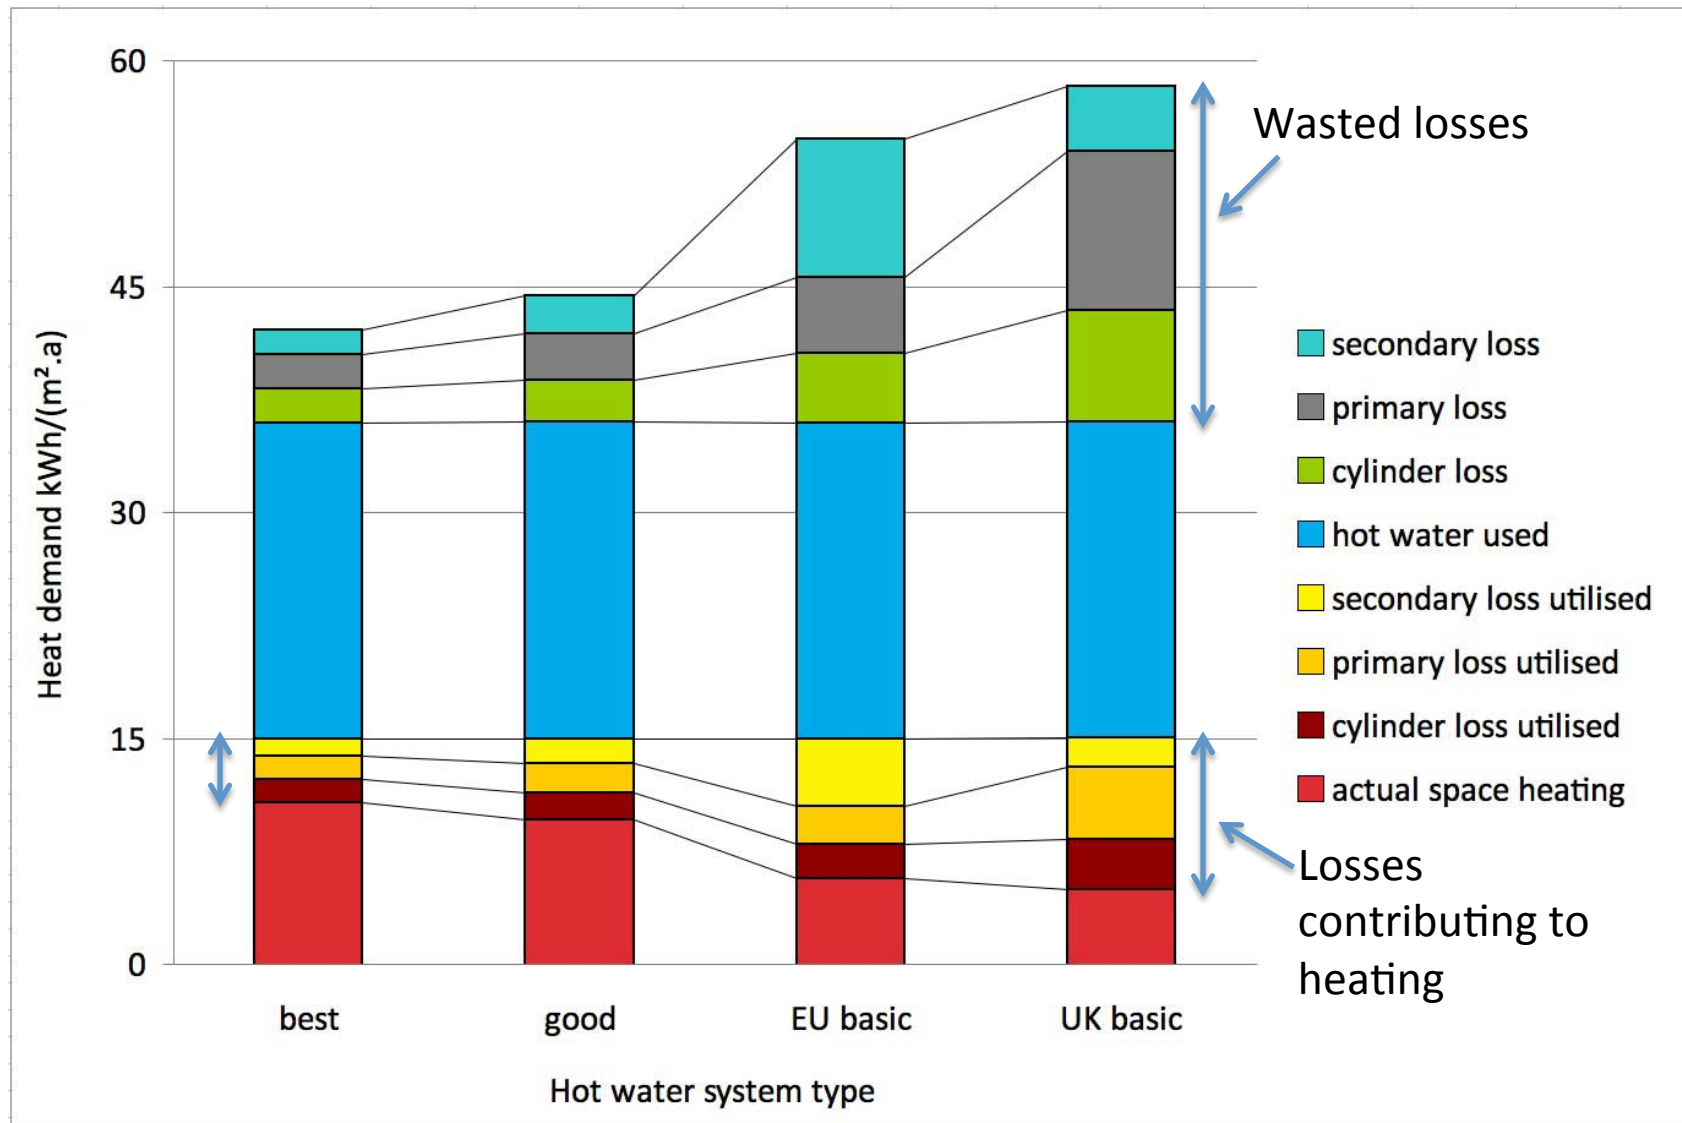

George Box

IHG assumptions will never be correct over the life of building but an improved heuristic\* model will better reflect reality for smaller and larger buildings.

The downsides of overestimating IHGs for small buildings are less than for underestimating.

\*Rule of thumb/trial and error

# 'The importance of hot water system design in the passivhaus' Clarke & Grant Dresden 2010

# Assume state of the art DHW

Dwelling will probably have either:

## 1. Hot water distribution from central system:

Say 15m x 15mm pipe with 25mm insulation  
= 45W ignoring conduction to outlets etc.

Or:

## 2. Storage:

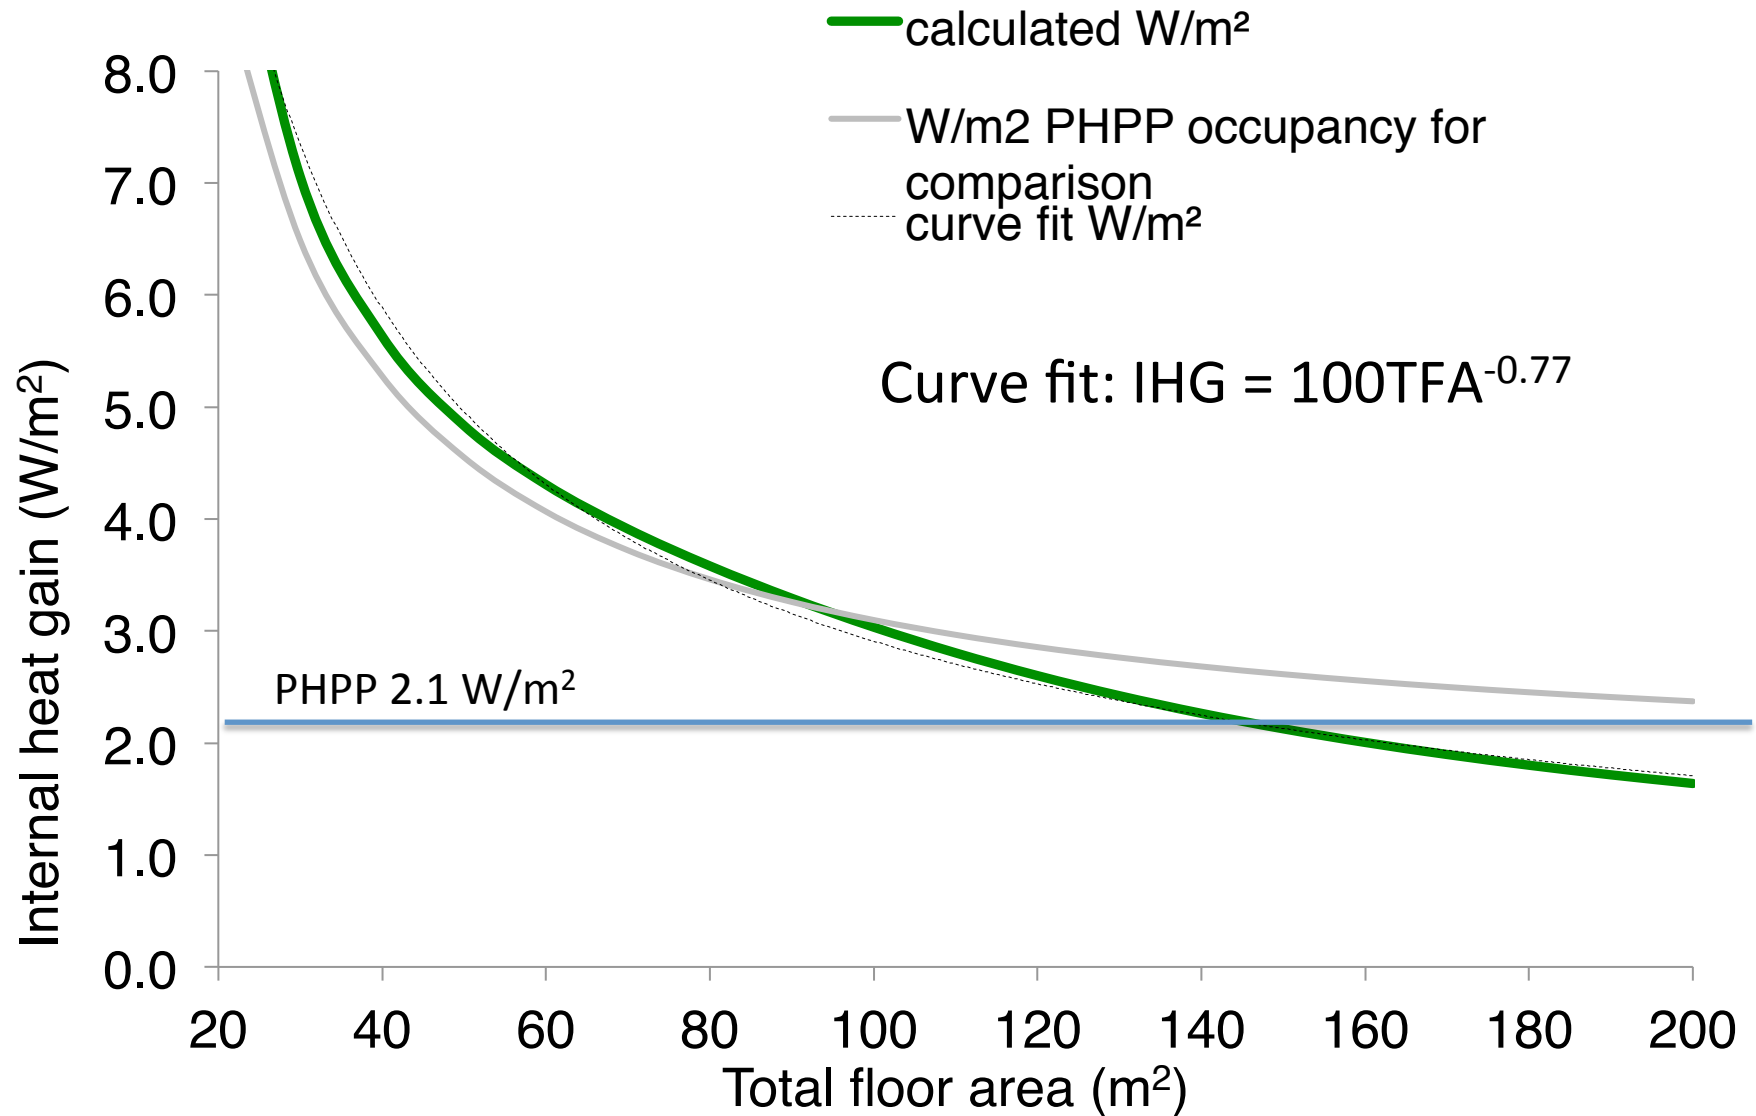

3W/K PHPP default = 120W

2W/K minimum in PHPP = 80W

Plus distribution losses and actual DHW use heating space

Can we agree **40W**/dwelling is a low estimate?

# IHG including 40W/dwelling DHW losses

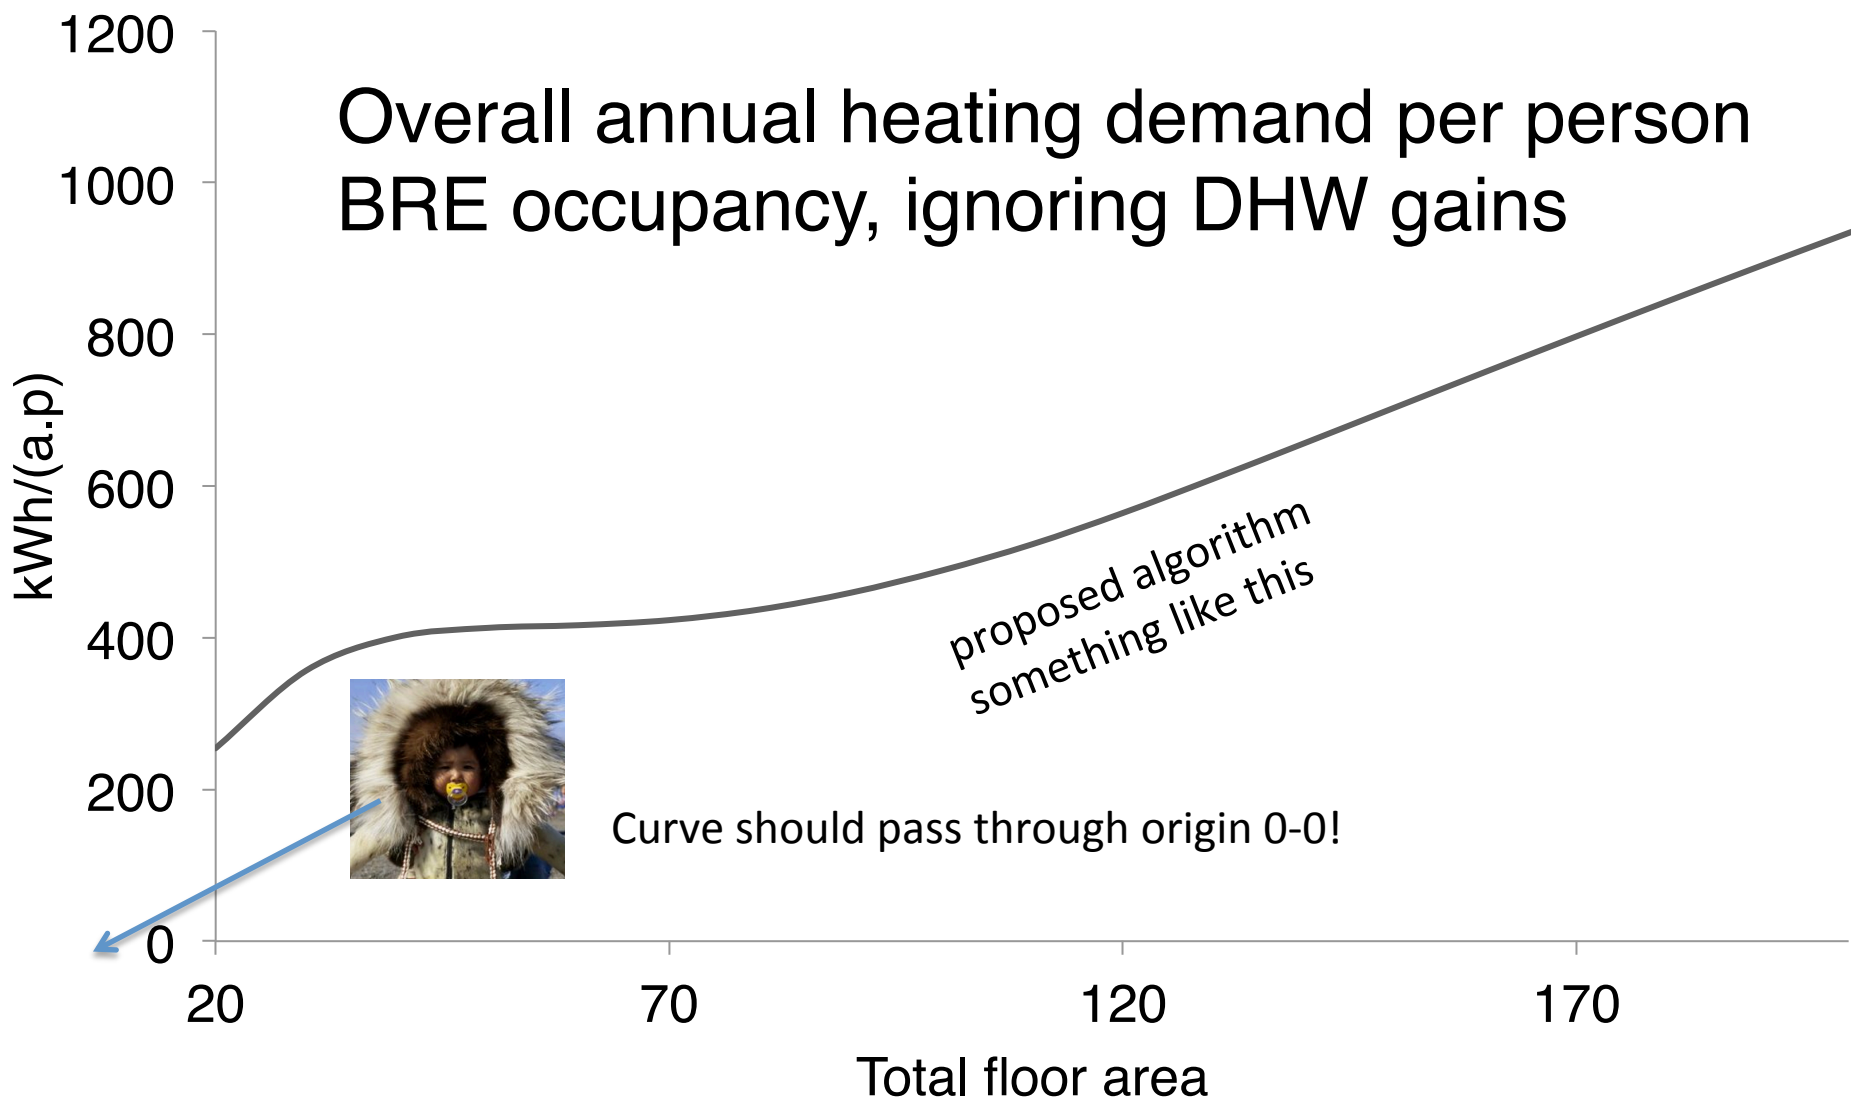

# Adding 40W/dwelling DHW gains

$$\text{IHG} = 100\text{TFA}^{-0.77}$$

# Small buildings do need less heat/p

# Conclusions

- kWh/(m<sup>2</sup>.a) metric validated, (usually criticised as favouring larger dwellings).
- Small homes work better than large ones.
- No relaxation is needed for small dwellings.
- Implications for summer overheating calculations.
- More realistic occupancy assumptions have implications for primary energy calculations.

# Schools (in brief)

37.7 °C

12.1

# Δ Metabolic Heat Gains Only

School	Children	TFA m <sup>2</sup>	m <sup>2</sup> /child
Bushbury Hill (UK)	240	1707	7.1
Oakmeadow (UK)	450	2205	4.9
Montgomery (UK)	446	2367	5.3
Swillington (UK)	240	1344	5.6
Wilkinson (UK)	459	2500	5.4
LH Hannover (D)	300	3507	11.7
Gronau (D)	336	2953	8.8
Reidberg (D)	500	5540	11.1

Average for UK examples 5.7 m<sup>2</sup>/child

Average for German examples 10.5 m<sup>2</sup>/child

Difference +1.32W/m<sup>2</sup>

**+ 5-6 kWh/(m<sup>2</sup>.a) of useful heating**  
Against 15kWh/(m<sup>2</sup>.a) target

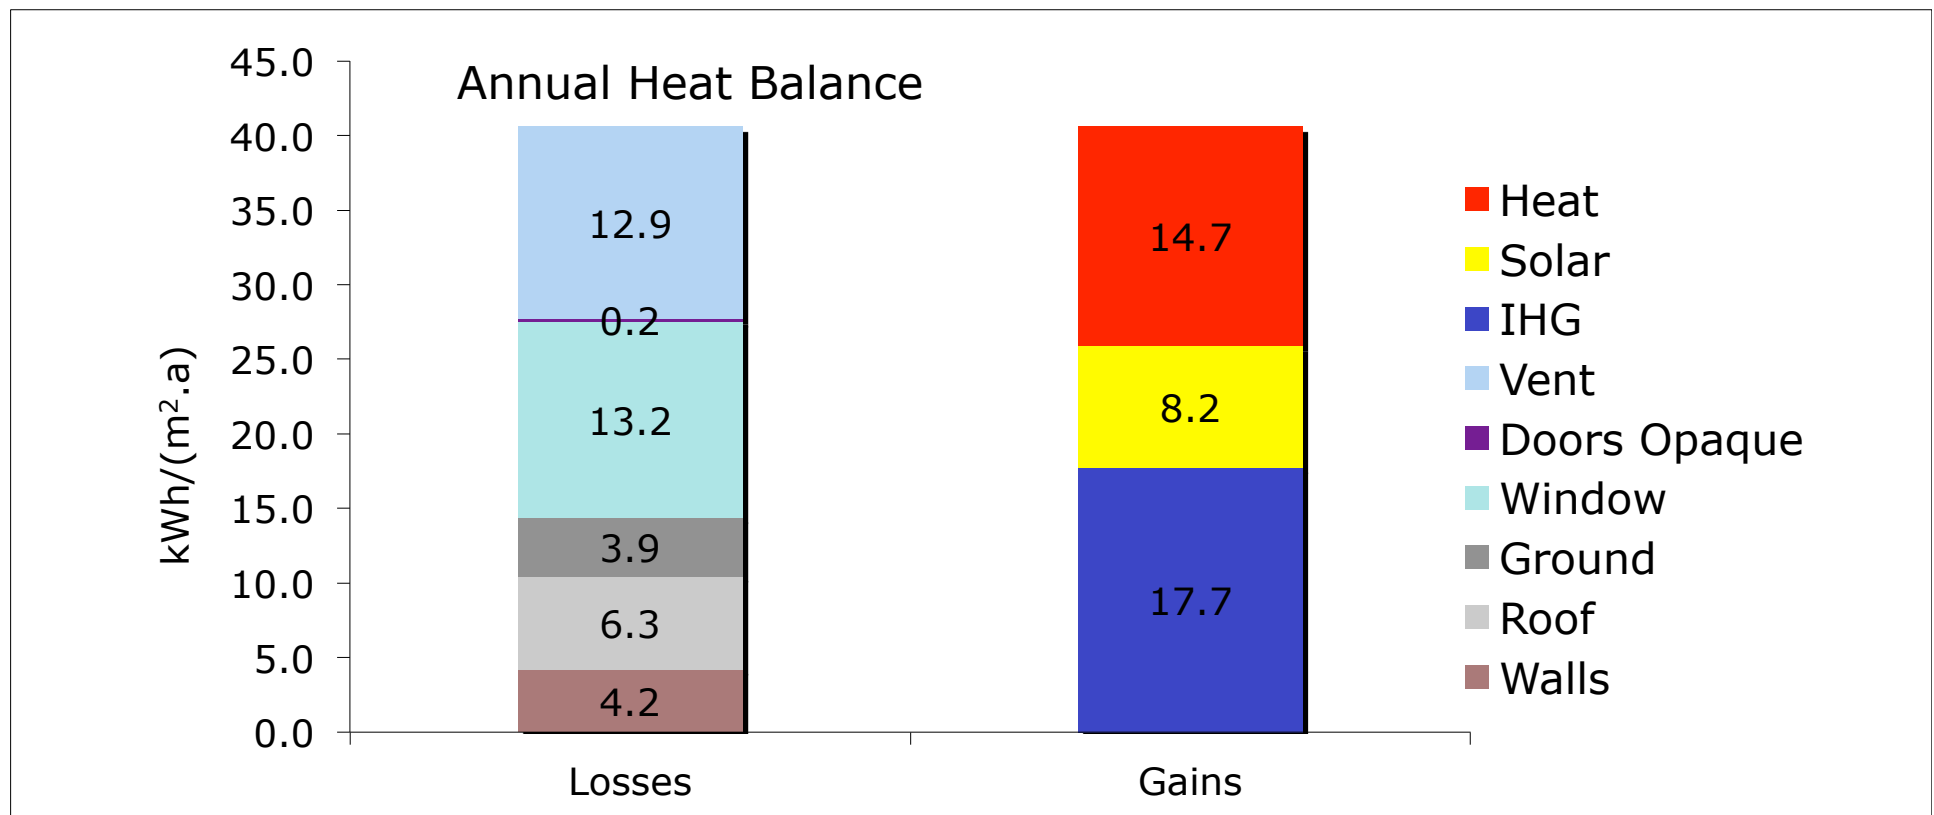

# Less reliance on solar gain

3.8W/m<sup>2</sup> v 2.8W/m<sup>2</sup> IHG

Means we designed a different building

50% v 60% g glass

No additional south glazing just to meet 15kWh/(m<sup>2</sup>.a)

# Schools Conclusions

- Design is very sensitive to IHG assumptions.
- Too low an IHG assumption favours passive solar design with associated high cost and increased overheating risk.
- Custom IHG calculations could lead to game playing but occupancy density and time should be factored in.
- More detailed analysis could not be fitted into this paper.
